Draft Talking Points Cottage Grove Wells

- As part of 3M's regular water quality monitoring at 3M Cottage Grove Center, we recently began testing well water for fluorochemicals.
- This latest action is made possible by improvements in analytical methods which now enable us to detect low levels of fluorochemicals in the parts per billion.
- Very low levels of fluorochemicals were found in well water at the site.
- 3M's medical department has analyzed the sampling results and determined that the potable well water does not present a health risk at the levels found.
- Nevertheless, as part of 3M's continuing effort to limit exposure to fluorochemicals, we will complete the site's transition to bottled water by:
 - 1. Providing bottled water in the 116 cafeteria for cooking and drinking.
 - 2. Providing bottled soda in the 116 cafeteria in place of the soda fountain.
 - 3. Providing bottled water for all coffee machines.

Points to Make In Response to Questions

- 3M and the Minnesota Department of Health have been monitoring well water quality since early 1980s part of our effort to ensure safe water supply.
- We included FCs in our monitoring program after improvements in analytical methods made it practical.
- The well water serves only a small part of our drinking water needs bottled water provides most of our drinking water.
- 3M screening level of 1PPB is simply an internal 3M tool to tell us to have medical look at it if it reaches that level.
- Levels found were low.
